

Distributed Operating Systems

Lecture 7

Distributed Operating Systems, Andrew Tanenbaum. In Search of Clusters, Gregory F. Pfister.

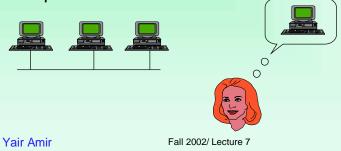

Yair Amir

Fall 2002/ Lecture 7

An operating system which manages a collection of independent computers and makes them appear to the users of the system as a single computer.

3

Hardware Architectures Parallel architecture Multiprocessors CPU CPU Memory Cache Cache - Tightly coupled. - Shared memory. Distributed architecture Multicomputers. Memory Memory Memory - Loosely coupled. CPU CPU CPU - Private memory. - Autonomous. Yair Amir Fall 2002/ Lecture 7

Software Architectures

- Multiprocessor OS
 - Looks like a virtual uniprocessor, contains only one copy of the operating system, communication via shared memory, single run-queue
- Network OS
 - Does not look like a virtual uniprocessor, contains n copies of the operating system, communication via shared files, n run-queues
- Distributed OS
 - Looks like a virtual uniprocessor (more or less), contains n copies of the operating system, communication via messages, n run-queues

Yair Amir Fall 2002/ Lecture 7 5

Design Issues

- Transparency
 - Location transparency
 - · Location of processes
 - · Location of cpu's and other devices
 - · Location of files
 - Replication transparency (of files)
 - Concurrency transparency (the user should not notice the existence of other users).
 - Parallelism transparency (the user should write a serial program, and the compiler and the OS will handle the rest) - this is not doable today

Design Issues (cont.)

- Performance
 - Throughput / response time
 - Load balancing (static/dynamic)
 - Communication is slow compared to processing speed: Fine grain / coarse grain
- Scalability
- Reliability
- Flexibility (Micro-kernel architecture).

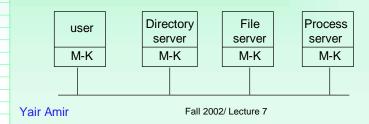

Yair Amir Fall 2002/ Lecture 7

Micro Kernel

Provides:

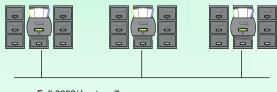

- Inter-process communication mechanisms
- Low level I/O
- Some memory management
- Process management and scheduling

All the rest is done in user level.

- File and directory naming
- · Semantics of file sharing
- · Implementation considerations
 - Caching
 - Update protocols
 - Replication

Yair Amir

Fall 2002/ Lecture 7

File and Directory Naming

- Machine + path naming /machine/path.
 - one name space, but not transparent.
- Mounting remote file systems onto the local file hierarchy.
 - The view of the file system may be different at each computer.
- A single name space that looks the same on all machines.
 - Full naming transparency.

Yair Amir

Fall 2002/ Lecture 7

10

File Sharing Semantics

- One-copy semantics (unix semantics).
 - Updates are written to the single copy and are available immediately.
- Serializability.
 - Transaction semantics (locking files share for read and exclusive for write).
- Session semantics.
 - Copy the file on open, work on local copy, and copy back on close.

11

Yair Amir Fall 2002/ Lecture 7

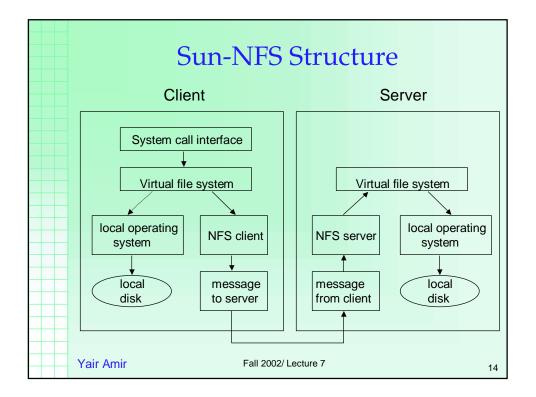

Sun-NFS

- Supports heterogeneous systems.
- Architecture
 - Server exports one or more directory trees for access by remote clients.
 - Clients access exported directory trees by mounting them to the client local tree.
 - Diskless clients can mount exported directory to their root directory.
 - Auto-mount (on the first access).

Sun-NFS (cont.)

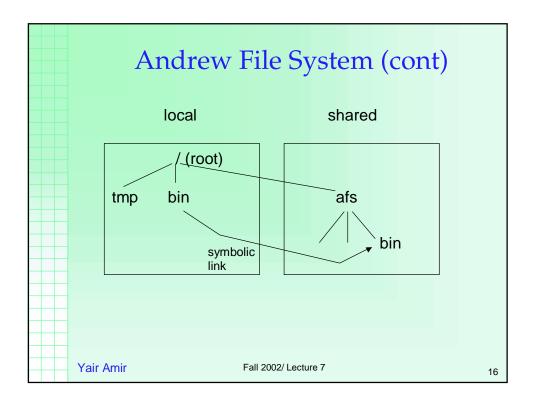

- Protocols
 - Mounting protocol
 - Directory and file accessing protocol
 - Stateless
 - No open / close messages.
 - Each read / write message contain the full path and file description position.
- Semantics
 - Not entirely Unix since there is no way to lock files

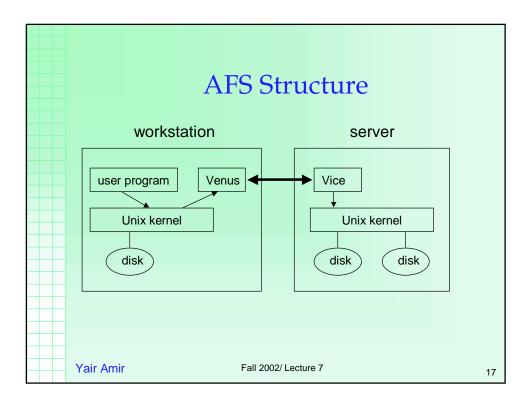

13

Andrew File System

- Supports information sharing on a large scale (thousands of workstations).
- · Uses a session semantics.
- The entire file is copied to the local machine (Venus) from the server (Vice) when open. If the file is changed - it is copied to the server when closed.
- The method works because in practice most files are changed by one person only (non-database).
- Measurements show that only 0.4% of changed files were updated by more than one user during one week.

AFS File Validation

- Older AFS versions:
 - On open: the Venus access the vice to see if its copy of the file is still valid. This causes a substantial delay even if the copy is valid.
 - The Vice is stateless
- Newer AFS versions:
 - The Vice maintains lists of valid copies. If a file is modified the Vice invalidates other copies.
 - On open: if the Venus has a valid copy it can open it immediately.
 - If Venus crashes it has to invalidate its version or check their validity.

18

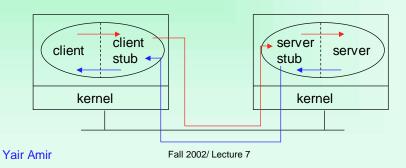

The Coda File System

- Descendant of AFS that is substantially more resilient to server and network failures.
- Support for "mobile" users.
- Directories are replicated in several servers (Vice)
- When the Venus is disconnected, it uses local versions of files. When Venus reconnects, it reintegrates using optimistic update scheme.

Yair Amir Fall 2002/ Lecture 7

Remote Procedure Call

A convenient way to construct a client-server connection without explicitly writing send/receive type programs (helps maintain transparency).

Remote Procedure Call (cont.)

- Client procedure calls the client stub in a normal way
- Client stub builds a message and traps to the kernel
- · Kernel sends the message to remote kernel
- · Remote kernel gives the message to server stub
- Server stub **unpacks** parameters and **calls** the server
- Server **computes** results and **returns** it to server stub
- Server stub **packs** results in a message and **traps** to kernel
- Remote kernel sends message to client kernel
- · Client kernel gives message to client stub
- Client stub **unpacks** results and **returns** to client

21

Fall 2002/ Lecture 7

RPC NG: DCOM & CORBA

- Object models allow services and functionality to be called from distinct processes
- DCOM/COM+(Win2000) and CORBA IIOP extend this to allow calling services and objects on different machines
- More OS features (authentication, resource management, process creation,...) are being moved to distributed objects.

Fall 2002/ Lecture 7

Process Migration

- Load Balancing
 - Static load balancing CPU is determined at process creation.
 - Dynamic load balancing processes dynamically migrate to other computers to balance the CPU (or memory) load.
- · Migration architecture
 - One image system
 - point of entrance dependent system (the deputy concept)

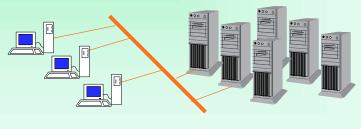

Yair Amir

Fall 2002/ Lecture 7

23

A Mosix Cluster

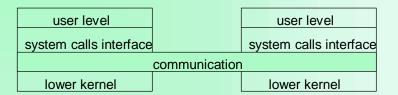

- Mosix (from Hebrew U): Kernel level enhancement to Linux that provides dynamic load balancing in a network of workstations.
- Dozens of PC computers connected by local area network (Fast-Ethernet and up).
- Any process can migrate anywhere anytime.

Yair Amir

Fall 2002/ Lecture 7

An Architecture for Migration

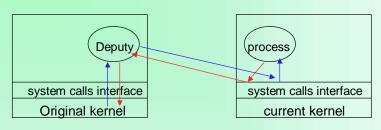

Architecture that fits one system image. Needs location transparent file system.

(Mosix previous versions)

Yair Amir Fall 2002/ Lecture 7

Architecture for Migration (cont.)

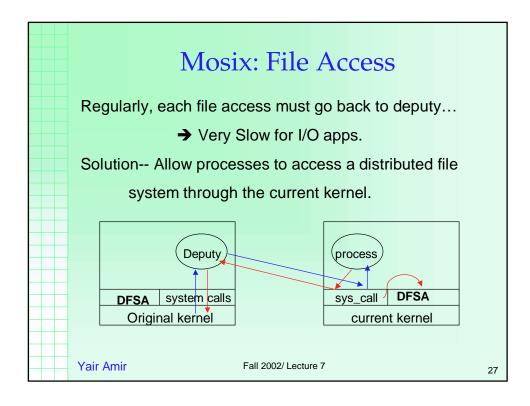

The process migrated from the original computer to the current computer and now is initiating a system call.

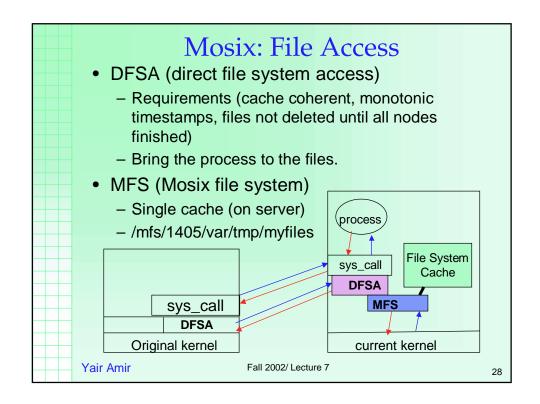

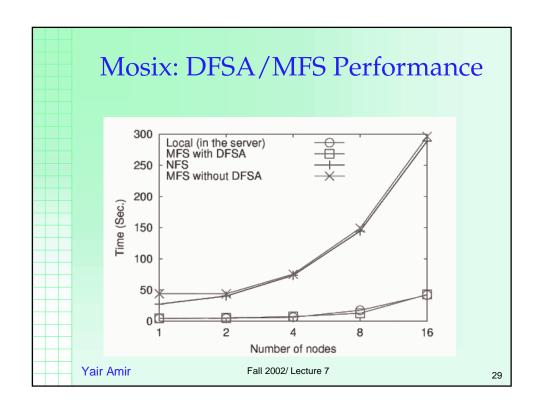

- Architecture that fits entrance dependent system.
- Easier to implement based on current
 Unix. (Mosix current versions)

Yair Amir Fall 2002/ Lecture 7

26

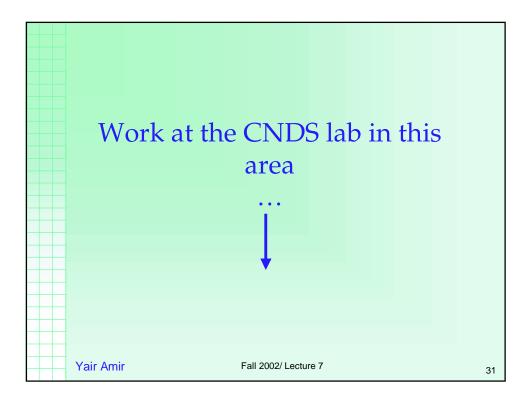

Other Considerations for Migration

- Not only CPU load!!!
- Memory.
- I/O where is the physical device?
- Communication which processes communicate with which other processes ?

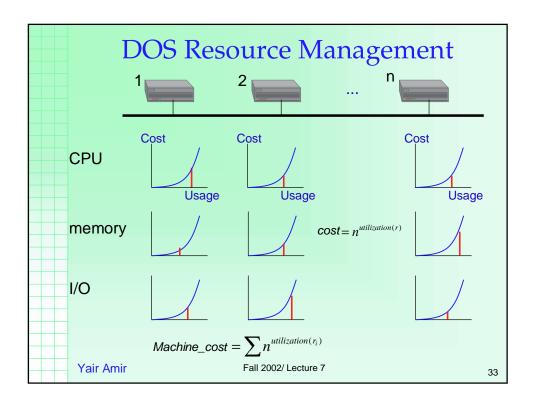

Yair Amir

Fall 2002/ Lecture 7

Resource Management of DOS

- A new online job assignment policy based on economic principles, competitive analysis.
- Guarantees near-optimal global lower-bound performance.
- Converts usage of heterogeneous resources (CPU, memory, IO) into a single, homogeneous cost using a specific cost function.
- Assigns/migrates a job to the machine on which it incurs the lowest cost.

What did we do?

We looked at two metacomputing systems: PVM and Mosix.

- PVM Parallel Virtual Machine
 - Static Assignment of jobs to machines.
 - Default round robin assignment policy.
 - Widely used.
- Mosix
 - Dynamic job migration.
 - Main objective is load balancing, with some adhoc heuristics for memory depletion.

Yair Amir

Fall 2002/ Lecture 7

Enhanced PVM and Enhanced Mosix

- Enhanced PVM is similar to PVM. The decision where to statically place a new job is made according to the cost benefit framework.
- Enhanced Mosix is similar to Mosix. Job migration decisions are made according to the cost-benefit framework.

This framework currently takes into account:

- CPU load
- · Memory utilization

We know how to add I/O and this is in the works.

We have no clue how to add IPC for the general case.

Yair Amir Fall 2002/ Lecture 7

35

Evaluation Methodology

• Cluster:

Machine Type	# of these Machines	Processing Speed	Installed Memory
Pentium Pro	3	200 MHz.	64 MB of RAM
Pentium	2	133 MHz.	32 MB of RAM
Laptop w/ Ethernet	1	90 MHz.	24 MB of RAM.

- Simulation:
 - 3,000 identical executions (scenarios) per policy, each represents 10,000 - 20,000 sec.
- Validation (real life executions):
 - 50 identical executions per policy (similar to the simulations).

Yair Amir Fall 2002/ Lecture 7
